SENG3011 Testing Documentation

Teams must produce 1 document describing the testing processes used in the development of the MSM module and attach their testing data.

The testing documentation should contain:

1. The latest version of your architecture. Indicate how MSM component was tested and the type of testing (functional or non-functional)
2. Describe your testing environment: e.g. environment and/or tools used, limitations (e.g. things that are not tested)
3. Overview of Test data (test cases).
4. Illustrate your testing process i.e. how your team conducts testing using the test data described earlier (e.g. in which order). How do you make sure you do not break old features when introducing new features ?

The testing document does not have to be long, 4-5 pages is a good average. As much as possible, it should refer to rather than duplicate information in the attached files.

The attached files should consist of:

1. Test input files (order files)
2. Test configuration files
3. Result files (if any)
4. Software or scripts used during testing (if any)
5. Documentation file (e.g. README)

The testing documentation will apply to the latest release of your software on your Web site. The final version of the testing report is expected as part of the Final Report in Week 12.

To submit the application, use the WebCMS to upload a compressed directory containing all your files. The file should be called testing.zip and it has a limit of 16 Mb.
